

[FACT SHEET] Real Time Rating

Real- Time Rating

Unicorn Real-Time Rating Module is part of the Unicorn Billing solution but can be deployed as a stand alone real-time rating engine. It sits independently from the network elements and is a combination of different processes, which are sequentially dependent on each other's output. The Unicorn Real-Time Rating Module manages resources optimally by using load balancing processes and reduces the possibility of failure by managing the process-state in real-time. The entire chain from the input of a delivery file of event details, to collection and posting priced event details into the database is considered as a rating pipe, which consists of different functional blocks. Multiple instances of such functional blocks scale up the capability of an individual pipe, whilst multiple pipes within one system increase the scalability and throughput of the system.

Benefits

- Real time rating for both pre-paid and post-paid
- Rate or discount on any unit of measurement
- Built-in rating/discounting algorithms with rules override
- Rating to facilitate comparison billing
- Event Pricing with multiple rating parameters
- Standalone rating capability
